Product Characteristic Curve

Note:

- Both the temperature derating curve and the efficiency curve are tested with typical values;
- The temperature derating curve is tested according to our laboratory test conditions. If the actual environmental conditions used by customers are inconsistent, it is necessary to ensure that the temperature of the aluminum casing of the product does not exceed 100 °C, and it can be used within any rated load range.

4. Sense usage and precautions

(1) Without far-end compensation:

Precautions:

1. Do not use remote compensation, make sure Vout+ and Sense+, Vout- and Sense- are short-circuited;
2. The connection between Vout+ and Sense+, Vout- and Sense- should be as short as possible and close to the pins, otherwise the module may become unstable.

(2) Using remote compensation

Precautions:

1. When the long-end compensation lead is used, the output voltage may be unstable;
2. If remote compensation is used, please use twisted pair or shielded wire, and keep the lead wire as short as possible;
3. Please use wide PCB leads or thick wires between the power module and the load, and keep the line voltage drop below 0.3V to ensure that the power output voltage remains within the specified range;
4. The impedance of the leads may cause the output voltage to oscillate or have larger ripples. Please verify it before use.

5. Use of TRIM and calculation of TRIM resistance

The relationship between output change voltage ΔU and resistance is as follows:

Voltage up regulation: add resistor R_{up} between Trim and output negative
 $R_{up} = 1275 / \Delta U - 5.1$ (K Ω)

Voltage Down: Add resistor R_{down} between Trim and output positive
 $R_{down} = 510 * (200 - 2.5 - \Delta U) / \Delta U - 5.1$ (K Ω)
